

How the App Speaks, Shows & Records

The three media pieces, as flowcharts: the spoken instructions (made by an AI voice), the little how-to demo clips, and the child's own session video. Each ends with one plain line — and a note on what's live versus waiting.

made on the Mac (before shipping)
inside the app
what the user gets
designed, not switched on

A Spoken instructions — the AI voice (Sarvam)

Every activity's step-by-step instructions can be heard aloud, in three Indian languages.

For users who are blind or low-vision, hearing the instructions matters more than reading them. The narration is made by **Sarvam AI** — an Indian text-to-speech service whose voices sound natural in Indian languages. Crucially, the audio is **made ahead of time on the Mac**, not generated live, so the app stays fast and works fully offline.

MAKING THE NARRATION — A ONE-TIME STUDIO STEP ON THE MAC

- 1 **Content team writes the steps** — in Hindi, Tamil, Bengali (real human translations, never machine-translated)
- ↓
- 2 **A small script sends each one to Sarvam** — the AI voice reads it back as audio
- ↓
- 3 **One sound file is saved per activity, per language** — tidied so "O&M" is spoken in full, with natural pauses
- ↓
- 4 **The files ship inside the app** — bundled like any built-in content

In plain terms: the AI does its work once, in the workshop. By the time the app reaches a teacher, the voices are already baked in — no internet, no waiting, no cost per play.

IN THE APP — THE TEACHER JUST PRESSES PLAY

If a language isn't ready yet: that button is shown but greyed out, with a gentle "not generated yet" note — nothing breaks, it just isn't offered.

Two deliberate guardrails worth knowing: the Sarvam key (the paid access code) **never** goes into the app — it lives only on the Mac during generation. And the app **never machine-translates**; it only ever speaks wording the content team actually wrote. The voice, speed, and language set are all easy to change and re-generate.

B How-to demo clips — the tutorial video

A short clip can show a teacher how to actually run an activity — not the child, the technique.

Each activity has a **video slot**. When a demo clip exists, the app shows a player; when it doesn't, it shows a tidy placeholder. These are **built-in teaching clips** — bundled with the app, the same as the audio — and this has already been proven to play on a real device.

PREPARING A DEMO CLIP — ALSO A MAC STEP

In plain terms: these are reference clips that travel *with* the app, so they always work offline. A teacher uncertain about a technique can watch the demo right where the instructions are.

Don't confuse these two videos: the **demo clip** (this section) teaches the *teacher* and ships inside the app. The **session video** (next section) records the *child's actual attempt* and would go to the cloud — and that one is not switched on yet.

C The child's session video — designed, switched off

Recording a child's actual attempt and storing it securely. Fully planned, deliberately not live.

This is the only piece that would leave the device. The intent: a teacher records a child performing an activity, and that clip is stored in the cloud (on Indian servers, kept separate from the local records). The plumbing is designed to mirror the existing safe "doorway" — but it stays **off** until a policy decision is made.

THE PLANNED FLOW (SHOWN DASHED = NOT ACTIVE YET)

WHY IT'S OFF — THE GATE IS A DECISION, NOT MISSING CODE

Has the data-sharing
& consent question
been answered?

YES

Switch on

video recording & cloud upload go live

NOT YET ← WE ARE HERE

Stays off

everything else ships safely without it

In plain terms: the engineering is ready to go. What it's waiting on is a human decision about consent and how records are shared — which is a product and policy call, not a build task.

D The three media pieces at a glance

Piece	What it is	Lives where	Status	The point
SOP narration (Sarvam AI)	spoken instructions	inside the app, offline	In progress	accessibility for blind/low-vision users
Demo clip (tutorial video)	how-to technique video	inside the app, offline	Slot proven	helps the teacher run it right
Session video	the child's actual attempt	secure cloud (India)	Designed, off	review & assess later — waits on consent
